

**CHAPTER - THREE**

**FUZZY LATTICES**

### Chapter 3

#### ★ Fuzzy Lattices ★

##### §3.1 Definition:

“A fuzzy partially ordered set  $X$  is called a Fuzzy Lattice if every two elements (i.e., every pair of elements) in  $X$  has a fuzzy least upper bound and a fuzzy greatest lower bound.”

Let  $\langle X, R \rangle$  be fuzzy partial ordered set. Let  $x, y \in X$ . If fuzzy least upper bound denoted by  $x \vee y$  and fuzzy greatest lower bound denoted by  $x \wedge y$  exists for all  $x, y \in X$  then  $\langle X, R \rangle$  is a fuzzy lattice.

##### Examples:

- 1) Let  $X = [a, a + n]$  where  $a, n \in \mathbb{R}$  and  $n > 0$ . Let  $R =$  “almost less than or equal to” be a fuzzy relation defined on  $X$  as a function  $R: X \times X \rightarrow [0,1]$  defined by,

$$\begin{aligned} R(x, y) &= 1 && \text{if } x = y \\ &= (y - x) / n && \text{if } x < y \\ &= 0 && \text{else.} \end{aligned}$$

Then  $(X, R)$  is a fuzzy lattice.

Proof: - First we will prove that  $(X, R)$  is a fuzzy poset.

i) **Fuzzy Reflexivity:**

$$\text{Now, } R(x, x) = 1 \quad \forall x \in X. \quad (\text{by definition of } R)$$

$\therefore R$  is a fuzzy reflexive relation.

ii) **Fuzzy Perfectly Antisymmetry:**

Let  $x \neq y$  in  $X$  and  $R(x, y) > 0$

$$\text{Now, by definition of } R, R(x, y) = (y - x) / n$$

$$\therefore x < y$$

$$\therefore R(y, x) = 0 \quad (\text{by definition of } R)$$

$\therefore R$  is a fuzzy perfectly antisymmetric relation.

**iii) Fuzzy max-min transitivity:**

Let  $(x, z) \in X^2$ .

To prove:  $R(x, z) \geq \max_{y \in X} \min (R(x, y), R(y, z))$  \_\_\_\_\_ (1)

case a) Let  $x = z$ ,

$$\therefore R(x, z) = 1$$

$$\therefore R(x, z) \geq \max_{y \in X} \min (R(x, y), R(y, z))$$

case b) Let  $x < z$

for all  $y \in X$  such that  $y < x$ ,

$$R(x, y) = 0 \quad (\text{by definition of } R)$$

$$\therefore \min (R(x, y), R(y, z)) = 0$$

for all  $y \in X$  such that  $y = x$ ,

$$R(x, y) = 1 \text{ and } R(x, z) = R(y, z)$$

$$\therefore \min (R(x, y), R(y, z)) = R(y, z)$$

$$\therefore \min (R(x, y), R(y, z)) = R(x, z)$$

for all  $y \in X$  such that  $x < y < z$ ,

$$R(x, y) < R(x, z) \text{ and } R(y, z) < R(x, z)$$

$$\therefore \min (R(x, y), R(y, z)) < R(x, z)$$

for all  $y \in X$  such that  $y = z$ ,

$$R(y, z) = 1 \text{ and } R(x, z) = R(x, y)$$

$$\therefore \min (R(x, y), R(y, z)) = R(x, y)$$

$$\therefore \min (R(x, y), R(y, z)) = R(x, z)$$

for all  $y \in X$  such that  $z < y$ ,

$$R(y, z) = 0 \quad (\text{by definition of } R)$$

$$\therefore \min (R(x, y), R(y, z)) = 0$$

Thus,  $R(x, z) \geq \max_{y \in X} \min (R(x, y), R(y, z))$

case c) Let  $x > z$   
 $\therefore R(x, z) = 0$   
 Thus to prove:  $\max_{y \in X} \min (R(x, y), R(y, z)) = 0$   
 i.e., To prove,  $\min(R(x,y), R(y,z)) = 0 \quad \forall y \in X$   
 for all  $y$  such that  $y \leq z$ , Hence  $y < x$   
 $\therefore R(x, y) = 0$   
 $\therefore \min (R(x, y), R(y, z)) = 0$   
 for all  $y$  such that  $z < y < x$ ,  
 $\therefore R(x, y) = 0$  and  $R(y, z) = 0$   
 $\therefore \min (R(x, y), R(y, z)) = 0$   
 for all  $y$  such that  $z < x \leq y$ ,  
 $\therefore R(y, z) = 0$   
 $\therefore \min (R(x, y), R(y, z)) = 0$   
 $\therefore \min (R(x, y), R(y, z)) = 0 \quad \forall y$

Thus from case (a), (b) and (c), equation in (1) holds true.

Thus  $R$  is fuzzy max – min transitive relation.

Hence  $(X, R)$  is fuzzy partial order set.

Now we will prove that any two-elements set in  $X$  has fuzzy least upper bound and fuzzy greatest lower bound.

So let  $A = \{x, y\} \subseteq X$  where  $x \neq y$

Now  $x, y \in X \subseteq \mathbb{R}$

$\therefore$  Either  $x < y$  or  $y < x$

Let without loss of generality,  $x < y$

$\therefore R(x, y) = (y - x) / n$  and

$\therefore R(y, x) = 0$  (By definition of  $R$ )

Now by Definition of  $R_{\geq}$ , We have

$$\therefore R_{\geq}[x] = \left\{ \frac{0}{u_1} + \frac{1}{u_2} + \frac{(u_3 - x) / n}{u_3} \middle/ \begin{array}{l} u_1 < x, u_2 = x, u_3 > x \\ u_1, u_2, u_3 \in X \end{array} \right\}$$

$$\therefore R_{\geq}[y] = \left\{ \frac{0}{v_1} + \frac{1}{v_2} + \frac{(v_3 - y) / n}{v_3} \middle/ \begin{array}{l} v_1 < y, v_2 = y, v_3 > y \\ v_1, v_2, v_3 \in X \end{array} \right\}$$

Now,  $U(R, A) = R_{\geq}[x] \cap R_{\geq}[y]$

$$\therefore U(R, A) = \left\{ \frac{(y - x) / n}{y} + \frac{(m - y) / n}{m} \middle/ m > y \right\}$$

Now, Clearly ' y ' is a fuzzy least upper bound of a set A. Similarly, ' x ' is a fuzzy greatest lower bound of a set A. Thus the set A has fuzzy least upper bound and fuzzy greatest lower bound.

Hence every two element non-fuzzy subset of X has a fuzzy least upper bound and fuzzy greatest lower bound.

Hence,  $\langle X, R \rangle$  is a fuzzy lattice. □

2) Consider  $X = \{x_1, x_2, x_3, x_4, x_5\}$  and

$R(X, X)$  is given by membership matrix as follows:

	$x_1$	$x_2$	$x_3$	$x_4$	$x_5$	$x_6$
$x_1$	1	0	0	0	0	0
$x_2$	0.6	1	0	0	0.8	0
$x_3$	0.6	0.9	1	0.1	0.8	0.4
$x_4$	0	0	0	1	0.3	0
$x_5$	0	0	0	0	1	0
$x_6$	0	0	0	0	1	1

The Hasse diagram is,

Here the ordered pair  $(X, R)$  is a fuzzy lattice. □

**Note:** Every fuzzy lattice is a fuzzy partial order set

**But converse need not be true.**

**Counter Example:** Let  $X = \{x_1, x_2, x_3, x_4, x_5, x_6\}$  and

$R(X, X)$  is given by membership matrix as follows:

	$x_1$	$x_2$	$x_3$	$x_4$	$x_5$
$x_1$	1	0.8	0.2	0.6	0.6
$x_2$	0	1	0	0	0.6
$x_3$	0	0	1	0	0.5
$x_4$	0	0	0	1	0.6
$x_5$	0	0	0	0	1

The Hasse diagram is,

Here  $(X, R)$  is a partially order set.

Consider  $A = \{x_1, x_5\}$

Now,  $R \geq [x_1] = \{1/x_1\}$  and  $R \geq [x_5] = \{1/x_5\}$

Now,  $U(R, A) = R \geq [x_1] \cap R \geq [x_5]$  (Refer §2.4.1)

$\therefore U(R, A) = \emptyset$

i.e. fuzzy least upper bound of  $A$  does not exist.

$\therefore$  The ordered pair  $(X, R)$  is not a fuzzy lattice.  $\square$

### §3.2 PROPERTIES OF FUZZY LATTICES:

Idempotent Law:  $x \vee x = x$  and  $x \wedge x = x$

Commutative Law:  $x \vee y = y \vee x$  and  $x \wedge y = y \wedge x$

Associative Law:  $x \vee (y \vee z) = (x \vee y) \vee z$

and  $x \wedge (y \wedge z) = (x \wedge y) \wedge z$

Absorption Law:  $x \vee (x \wedge y) = x$  and  $x \wedge (x \vee y) = x$

#### ➤ Theorem 3.1:

If  $X$  is a non-empty non-fuzzy set in which two fuzzy binary operations  $\wedge, \vee$  are defined and satisfy the above stated properties, then a fuzzy partial order can be defined on set  $X$  such that  $X$  becomes a fuzzy lattice in which  $x \vee y$  and  $x \wedge y$  are fuzzy least upper bound and fuzzy greatest lower bound of non-fuzzy subset  $\{x, y\}$  of  $X$  respectively.

#### Proof:

Let  $X$  be a non-empty and non-fuzzy set in which two fuzzy binary operations  $\wedge, \vee$  are defined and satisfy the above stated properties.

Define a fuzzy relation  $R : X \times X \rightarrow [0, 1]$  as,

$\forall x, y \in X$  and  $n \in (0, 1)$ ,

$$\begin{aligned} R(x, y) &= 1 && \text{if } x = y \\ &= n && \text{if } x \vee y = y \text{ and } x \wedge y = x \\ &= 0 && \text{else} \end{aligned}$$

To prove:  $(X, R)$  is a fuzzy partial order set.

i) **Fuzzy Reflexivity:**

Now, by definition of  $R$ ,

$$R(x, x) = 1 \quad \forall x \in X.$$

$\therefore R$  is a fuzzy reflexive relation.

ii) **Fuzzy Perfectly Antisymmetry:**

Let  $x \neq y$  and  $R(x, y) > 0$

$$\therefore R(x, y) = n \quad (\text{by definition of } R)$$

$$\therefore x \vee y = y \text{ and } x \wedge y = x \quad (\text{by definition of } R)$$

By commutative property,

$$y \vee x = x \vee y = y \neq x \text{ and } y \wedge x = x \wedge y = x \neq y$$

Thus  $y \vee x \neq x$  and  $y \wedge x \neq y$

$$\therefore R(y, x) = 0 \quad (\text{by definition of } R)$$

$$\text{Thus } x \neq y \text{ and } R(x, y) > 0 \Rightarrow R(y, x) = 0$$

$\therefore R$  is a fuzzy perfectly antisymmetric relation.

iii) **Fuzzy Max-Min Transitivity:**

Let  $(x, z) \in X^2$

$$\text{To prove: } R(x, z) \geq \max_{y \in X} \min (R(x, y), R(y, z))$$

$$\text{If } x = z \text{ then } R(x, z) = 1 \quad (\text{by definition of } R)$$

$$\therefore R(x, z) \geq \max_{y \in X} \min (R(x, y), R(y, z))$$

$$\text{If } x \neq z \text{ then either } R(x, z) = n \text{ or } R(x, z) = 0$$

case a) Let  $R(x, z) = n$

$\therefore x \vee z = z$  and  $x \wedge z = x$  (by definition of R)

Now, for all  $y \in X$  such that  $y = x$  and  $y \neq z$

$R(x, y) = 1$  and  $R(y, z) = n$  or  $0$

$\therefore \min(R(x, y), R(y, z)) = R(y, z)$   
 $= R(x, z)$  (As,  $y = x$ )

Now, for all  $y \in X$  such that  $y = z$  and  $y \neq x$

$R(x, y) = n$  or  $0$  and  $R(y, z) = 1$

$\therefore \min(R(x, y), R(y, z)) = R(x, y) = R(x, z)$

Now, for all  $y \in X$  such that  $y \neq x$  and  $y \neq z$

$R(x, y) = n$  or  $0$  and  $R(y, z) = n$  or  $0$

$\therefore \min(R(x, y), R(y, z)) = n$  or  $0$   
 $\leq R(x, z)$

Thus,  $R(x, z) \geq \max_{y \in X} \min(R(x, y), R(y, z))$

Case b) Let  $R(x, z) = 0$

$\therefore x \vee z \neq z$  or  $x \wedge z \neq x$  (by definition of R)

To prove:  $R(x, z) \geq \max_{y \in X} \min(R(x, y), R(y, z))$

OR  $0 \geq \max_{y \in X} \min(R(x, y), R(y, z))$   
 (since  $R(x, z) = 0$ )

OR  $\max_{y \in X} \min(R(x, y), R(y, z)) = 0$

OR  $\min(R(x, y), R(y, z)) = 0 \quad \forall y \in X$

OR  $R(x, y) = 0$  or  $R(y, z) = 0 \quad \forall y \in X$

OR equivalently for  $y \in X$ ,

Prove:  $R(x, y) = 0$  or  $R(y, z) = 0$

Let, if possible,  $R(x, y) > 0, R(y, z) > 0$

i.e.,  $R(x, y) \geq n$  and  $R(y, z) \geq n$

$\therefore x \vee y = y, x \wedge y = x, y \vee z = z, y \wedge z = y$

Now,  $(x \vee y) \vee z = y \vee z = z$  and

$(x \vee y) \vee z = x \vee (y \vee z) = x \vee z$

$\therefore x \vee z = z$

Also,  $(x \wedge y) \wedge z = x \wedge z$  and

$(x \wedge y) \wedge z = x \wedge (y \wedge z) = x \wedge y = x$

$\therefore x \wedge z = x$

Thus we get  $x \vee z = z$  and  $x \wedge z = x$

Which is a contradiction to given data.

$\therefore R(x, y) = 0$  or  $R(y, z) = 0$

Thus R is fuzzy max-min transitive relation.

Thus R is fuzzy partial order.

Thus  $(X, R)$  is a fuzzy partial order set.

Now, To prove :  $(X, R)$  is a fuzzy lattice.

Let,  $A = \{x, y\} \subseteq X$

Thus, To prove: Fuzzy least upper bound and fuzzy greatest lower bound of a non-empty non-fuzzy subset A of X exists and  $x \vee y$  and  $x \wedge z$  are the fuzzy least upper bound and fuzzy greatest lower bound of A respectively.

Now,  $\wedge$  and  $\vee$  are binary operations defined on X.

Hence  $x \vee y$  and  $x \wedge y$  exists in X.

Let  $x \vee y = z_1$  and  $x \wedge y = z_2$

Thus, to prove:  $z_1$  and  $z_2$  are the fuzzy least upper bound and fuzzy greatest lower bound of A respectively.

Consider,  $x \wedge z_1 = x \wedge (x \vee y) = x$  and

$x \vee z_1 = x \vee (x \vee y) = x \vee y = z_1$

Thus,  $x \wedge z_1 = x$  and  $x \vee z_1 = z_1$

Thus,  $R(x, z_1) > 0$

Similarly,  $R(y, z_1) > 0$

$\therefore \min (R(x, z_1), R(y, z_1)) > 0$

$\therefore \min (R_{\geq}[x] (z_1), R_{\geq}[y] (z_1)) > 0$  (By definition of  $R_{\geq}$  class)

$\therefore (R_{\geq}[x] \cap R_{\geq}[y]) (z_1) > 0$  (By definition of Fuzzy intersection.)

$\therefore U(R, A) (z_1) > 0$  \_\_\_\_\_(1)(By definition of fuzzy upper bound)

Let  $m$  supports  $U(R, A)$ . i.e.,  $U(R, A) (m) > 0$

$\therefore (R_{\geq}[x] \cap R_{\geq}[y]) (m) > 0$  (By definition of fuzzy upper bound)

$\therefore \min (R_{\geq}[x] (m), R_{\geq}[y] (m)) > 0$  (Refer §1.2)

$\therefore \min (R(x, m), R(y, m)) > 0$  (By definition of  $R_{\geq}$  class)

$\therefore R(x, m) > 0$  and  $R(y, m) > 0$

$\therefore R(x \vee y, m) > 0$  (By theorem 2.2)

$\therefore R(z_1, m) > 0$

Thus,  $R(z_1, m) > 0$  for all  $m$  that supports  $U(R, A)$  \_\_\_\_\_ (2)

Thus, from (1) & (2), and by definition of fuzzy least upper bound  $z_1$  is a fuzzy least upper bound of  $A$  (Refer §2.5.1)

Similarly we can show that  $z_2$  is a fuzzy greatest lower bound of  $A$

Thus, any two elements non-fuzzy subset  $A$  of  $X$  has fuzzy least upper bound and fuzzy greatest lower bound.

i.e.,  $x \vee y$  and  $x \wedge y$  is a fuzzy least upper bound and fuzzy greatest lower bound for any  $x, y \in X$ .

Hence  $(X, R)$  is a fuzzy lattice. □

**§3.3 Fuzzy Lattice as Algebra:**

“If  $X$  is a non-empty, non-fuzzy set in which two fuzzy binary operations  $\wedge, \vee$  are defined and satisfy the four properties given below: Let  $x, y, z \in X$

- i) **Idempotent Law:**  $x \vee x = x$  and  $x \wedge x = x$
- ii) **Commutative Law:**  $x \vee y = y \vee x$  and  $x \wedge y = y \wedge x$
- iii) **Associative Law:**  $x \vee (y \vee z) = (x \vee y) \vee z$   
and  $x \wedge (y \wedge z) = (x \wedge y) \wedge z$
- iv) **Absorption Law:**  $x \vee (x \wedge y) = x$   
and  $x \wedge (x \vee y) = x$

Then  $\langle X, \wedge, \vee \rangle$  is called as Fuzzy lattice as Algebra.”

**§3.4 Fuzzy Complement of an element:**

**Definition:** Let  $(X, R)$  be a fuzzy lattice with 0 and 1. An element  $a' \in X$ , if exists, is a fuzzy complement of an element  $a \in X$  if  $a \wedge a' = 0$  and  $a \vee a' = 1$  (0 is fuzzy zero and 1 is fuzzy unit element of  $X$ )

e.g.  $X = \{x_1, x_2, x_3, x_4, x_5\}$  and

$R(X, X)$  is given by membership matrix as follows:

	$x_1$	$x_2$	$x_3$	$x_4$	$x_5$
$x_1$	1	0.8	0.2	0.6	0.6
$x_2$	0	1	0	0	0.6
$x_3$	0	0	1	0	0.5
$x_4$	0	0	0	1	0.6
$x_5$	0	0	0	0	1

The Hasse diagram is,

Here the ordered pair  $(X, R)$  is a fuzzy lattice.

Also,  $x_3$  is a fuzzy complement of  $x_2$  and vice versa.

$x_4$  is a fuzzy complement of  $x_2$  and vice versa.

**Note:** Fuzzy complement of an element need not be unique.

**Properties :**

- 1) Fuzzy complement of fuzzy zero is fuzzy unit i.e.,  $0' = 1$
- 2) Fuzzy complement of fuzzy unit is fuzzy zero i.e.,  $1' = 0$

### §3.5 Fuzzy Complemented Lattice: -

**Definition:** Let  $(X, R)$  be a fuzzy lattice with  $0$  and  $1$ . If  $a'$  i.e. fuzzy complement exists for all element  $a \in X$  then  $X$  is said to be Fuzzy Complemented Lattice.

e.g.:  $X = \{ x_1, x_2, x_3, x_4 \}$

$R(X, X)$  is given by membership matrix as follows:

	$x_1$	$x_2$	$x_3$	$x_4$
$x_1$	1	0.6	0.5	0.6
$x_2$	0	1	0	0.8
$x_3$	0	0	1	0.3
$x_4$	0	0	0	1

The Hasse diagram is,

Here the ordered pair  $(X, R)$  is a fuzzy lattice.

Now,  $x_1' = x_4, x_2' = x_3, x_3' = x_2, x_4' = x_1$

Thus fuzzy complement exists for all elements in  $X$ .

Hence  $X$  is said to be Fuzzy Complemented Lattice.
