Sample of Simulated Data List	166
Analysis Report of Simulated Data	171
Simulated Data Graphs	175

Introduction

Simulation is the technique of imitating the behavior of any system under study. It is an experimental technique, fast and relatively inexpensive. Problem solution is achieved by designing, constructing and manipulating a model of the real system.

With the introduction of digital computers, simulation has found a great number of applications in various fields. Computers enable system studies that are faster, more reliable and cheaper than any other method. Simulation is especially popular in situations where observations of a real-life system are not practical. This impracticality may be due to various reasons like cost, time or when the system under study is hazardous.

Simulation allows all combinations of variables and their subsequent effect on the entire system. Repeating the experiment several times often reveals bottleneck (congestion) activities. The computer increase the speed at which simulations can be run, eliminates much human error and allows iterations as many times as required.

The Kolhapur Reservation System was studied using the simulation techniques designed for discrete events. An event-to-event model was designed and a computer program then written to accept sample data. The program calculates statistics on both sample and generated data. Numerical tables and bar graphs form the output reports from the program.

Logical Design of Simulation Program

The computer language used to develop the program is Microsoft Quick BASIC. It is an advanced form of BASIC. Logical design, simulation flowchart, and source program listing are available in this section.

The program is developed for Multi Queue Multi Server type of queuing problem. It can also be used for Single Server Single Queue type. The program also handles situations in which multiple counters offer multiple or same service. It does not cover Multi Stage Server simulation.

Program listing includes list of variables and their usage. This shows all the variables used in the program.

Program operation is as follows:

Arrival, departure and call times (of sample data) are fed into the computer via the keyboard. This is done after replying to questions asked by the program. These questions relate to volume of sample data collected: number of weeks, starting date, number of counters, number of working days, etc.

The next step is to obtain a list of the limits of arrival gaps, service times and counter numbers via option 3 of the program. At this stage, selecting option 5 simulates the system. After answering further questions (required duration of simulation, starting date, etc.), graphs, lists of sample data, analysis report and queue length can be obtained by selecting the respective options displayed on the screen at each stage.

List of main menu options are as follows:-

Option 1 Sample Data Entries

- a) Fresh Entry
- b) Continuation of Previous Entry

Option 2. List of Data

- a) On Screen
 - i. Sample Data
 - ii. Simulated Data
- b) On Printer
 - i. Sample Data
 - ii. Simulated Data

Option 3. List of Limits of

- a) Service time
- b) Arrival gaps
- c) Counter Number

Option 4. Length of Queues

Generated report provides maximum length of queue and average length of queues for each individual counter.

Option 5. Simulation

This option simulates the model built by the computer for any length of time. Length of time is stated in number of weeks from a given date; generated data is stored in various files.

Option 6. Graphs

Graphs of arrival gaps, service times and arrival patterns can be obtained. This thesis only included arrival patterns for individual counters.

Option 7. Analysis of Data

This option generates a report on statistical measures which include average arrivals per

day, average waiting time per customer, average arrival gap, average service time, traffic intensity and server utilization for individual counters.

Sample Data Files are as follows:-

MASTDAT.FIL: This file contains information on office timings, type of counter operations, duration of sample data collection and number of working days. Recording format of time is in seconds.

MASTFIL.FIL This file contains the above information relating to the system. Time format is HH:MM:SS (Hours:Minutes:Seconds).

SAMARGAP.FIL Contains data on the number of people that arrived with various time gaps on different days of the week.

SAMSER.FIL Contains data on number of people served, with various service times on different days of the week.

SAMTDAT.FIL Contains cumulative information on total waiting times of all customers in the system for individual counters, total service times, total arrival gaps and total counter idle times.

SAMPNO1.FIL Contains total number of arrivals per day of the week for all weeks added up for all counters in the system.

SAMPNO2.FIL Contains total number of arrivals per day of the week for all weeks, for individual counters.

SAMPNO3.FIL Contains total number of arrivals per hours of all days of a week, for all weeks at individual counters.

SAMPNO4.FIL Contains information on total number of arrivals per hours of the day for all weeks for all counters.

SAMPNO5.FIL Contains information on total number of arrivals per hours, of the day of the week, for all weeks taking all counters together.

TABLEDAT.FIL Contains information on sample data: arrival, departure and call times, customer number, counter number and date. Time is recorded in HH:MM:SS format.

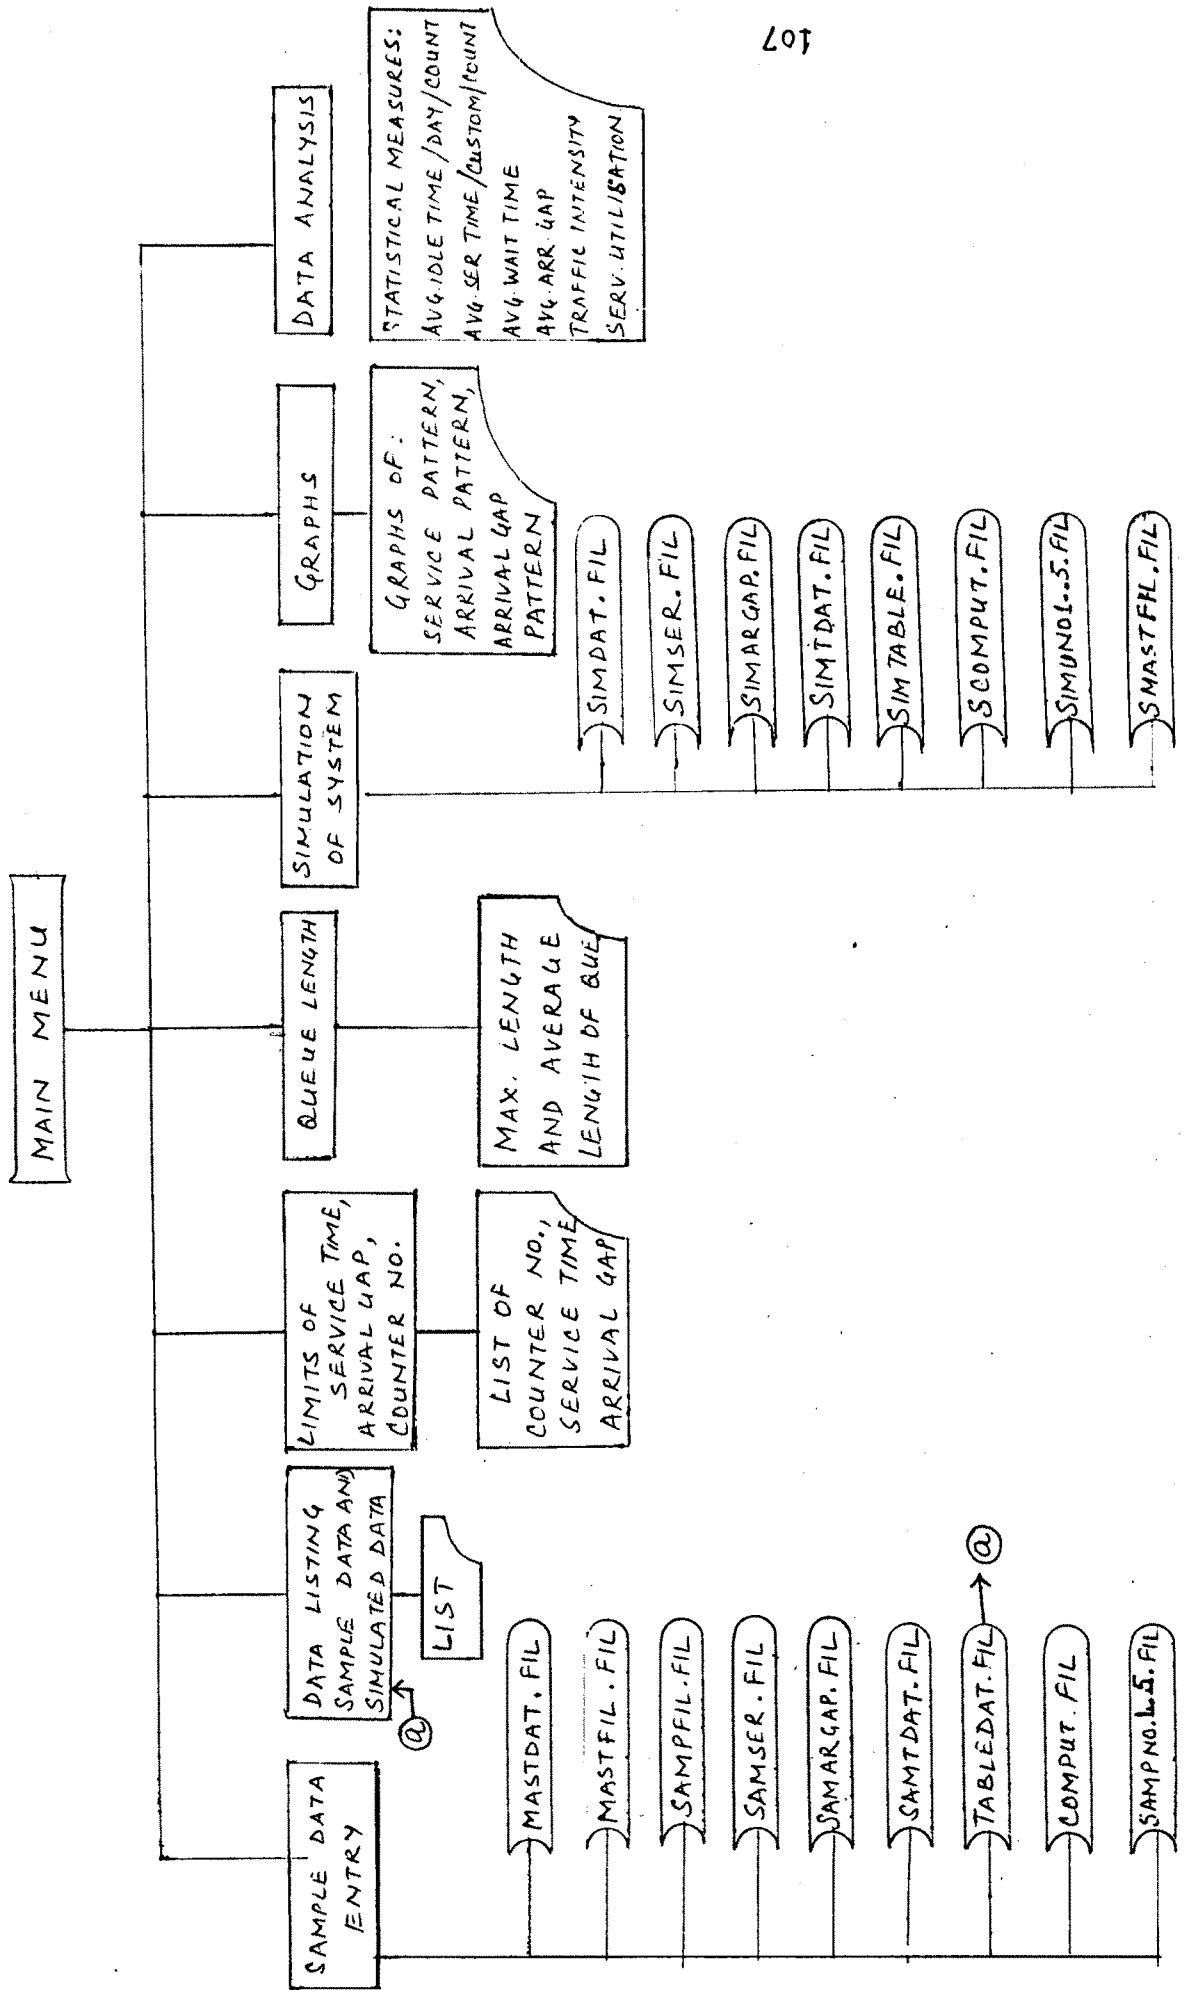

SAMDAT.FIL Contains the above information, recorded in seconds.

COMPUT.FIL This file contains information on waiting, service and counter idle times, counter number and customer number. Time is recorded in seconds.

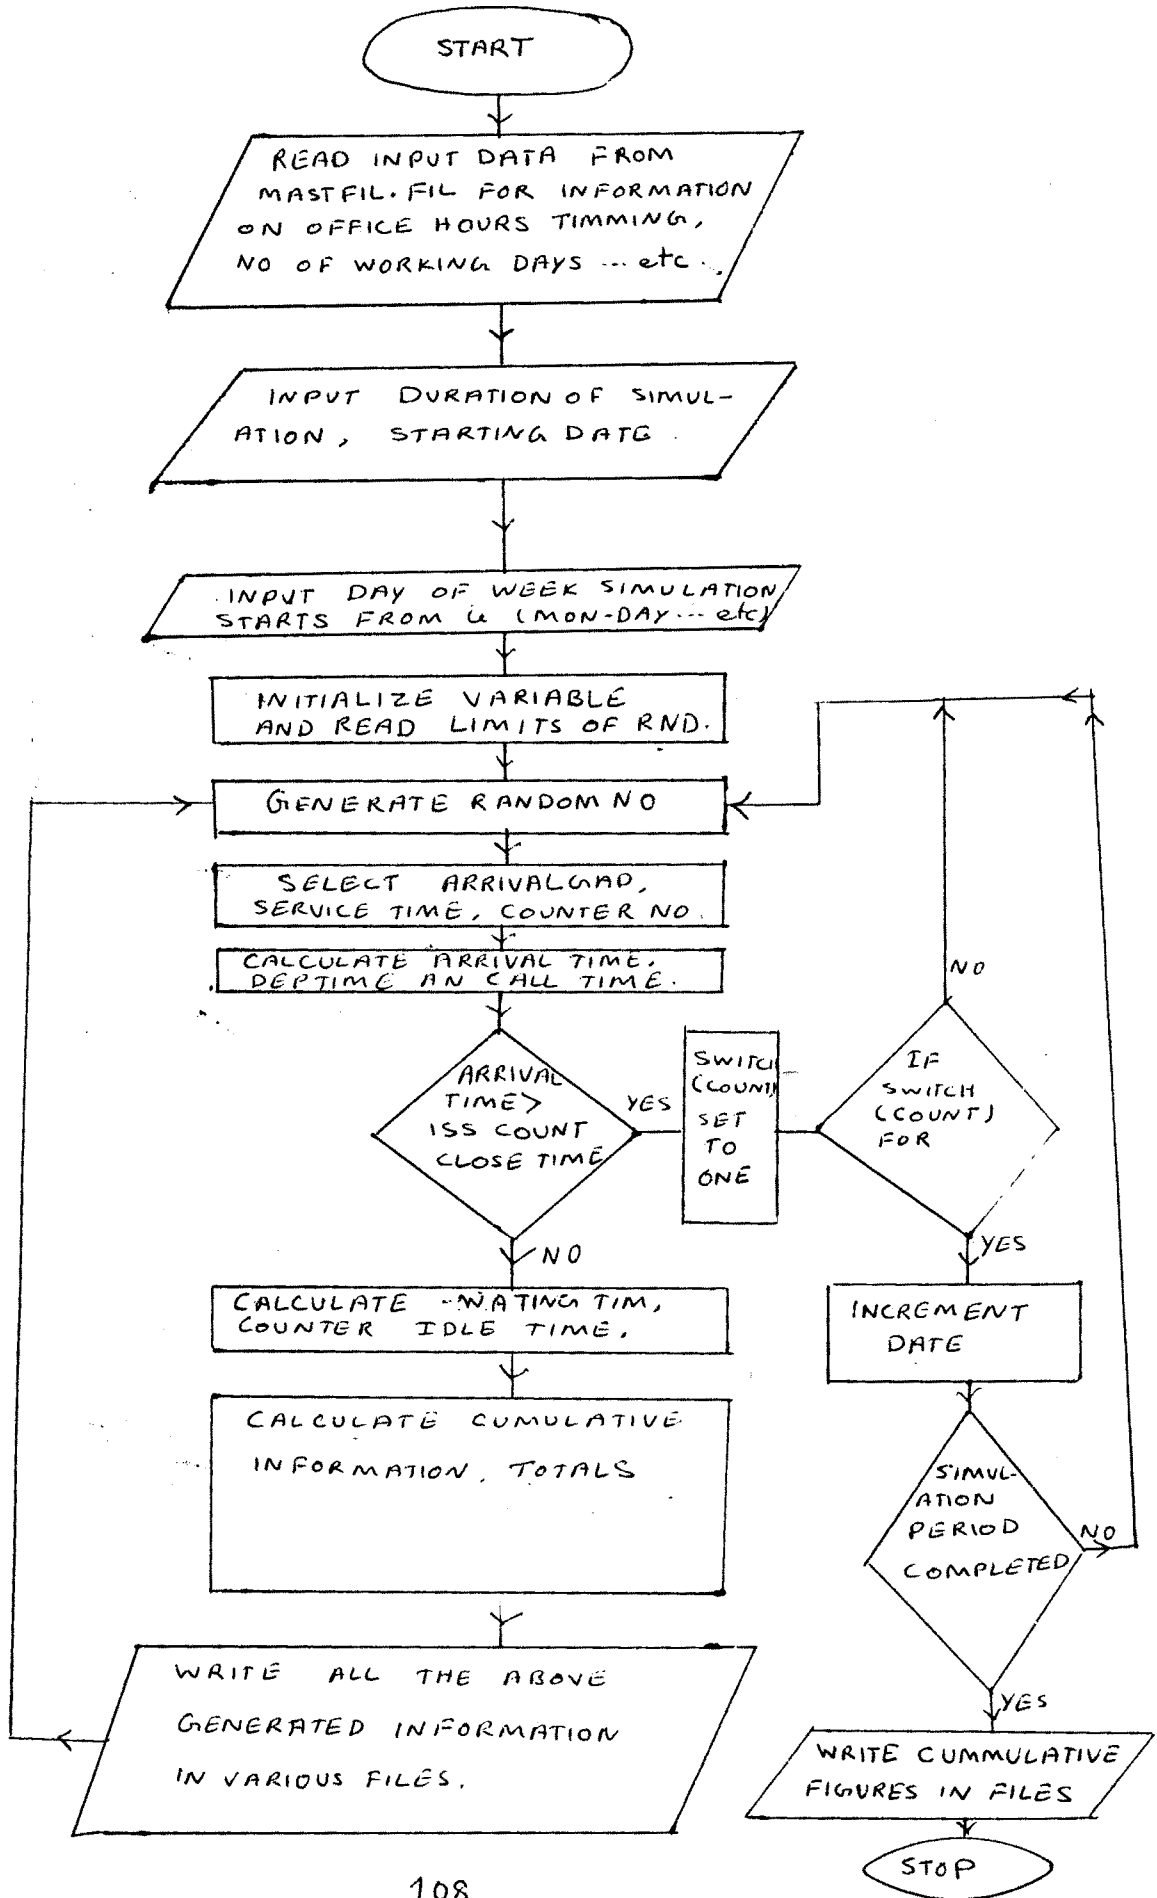

These files are used by the computer to generate reports, graphs and lists at several stages during and after the simulation. Repeated data entry is therefore not required.

There are similar files generated by the computer which contain simulated data. This data has the same format as sample data files.

LOGICAL DESIGN

FLOW CHART OF SIMULATION OF SYSTEM

SIMULATION OF QUEUING SYSTEM

THIS PROGRAM IS DESIGNED FOR SINGLE SERVICE SINGLE SERVER

MULTI QUE MULTI SERVER (FOR ONLY SINGLE STAGE OF SERVICE)

* PROGRAM DEVELOPED *

* BY *

* ABBAS JANAT MAKAN SHAD *

Simulated Class Intervals/ Limits

The tables of simulation class limits in random number generation for individual counters every day of the week for selection of arrival gap, service time and counter number are presented in this section.

These class intervals are generated and tabulated by the program, when Option 3 is selected based on the sample data collected. These tables are used by the program for random counter selection, customer service time and interarrival gap between this customer and the previous one, while the simulation is running. Arrival, call and departure times are then calculated by the program.

The procedure for calculating arrival, call and departure times of any customer in the system is as follows:-

The program generates a random number for a counter number to which an imaginary customer has to go. It checks the class interval for counter number and day of the week currently in consideration. To calculate the arrival gap, another random number is generated and compared with arrival gap class intervals. A third random number is generated and compared with class intervals of service times to select service times. Now the program calculates arrival time, call time and departure time of the customer as well as customer waiting time and counter idle time.

The steps in calculation are as follows:-

Arrival time = Previous Arrival time + Arrival gap

Call time = Previous Departure time (if arrival time is less than previous departure time)

OR ELSE Call time = Arrival time

Departure time = Call time + Service time

Waiting time = Departure time - Arrival time

Counter Idle time = Arrival time - Previous departure time

The format of the limit tables are shown below:-

Col 1	Col 2	Col 3	Col4	Col5	Col 6
Total No. of Arrivals /DayofWk	a) Arr. Gap b) Ser Time c) Count. No.	Average No. of arr/day of week	Cum. Ave arr	Prob. of arr	Randon No. of limit

The first column represents the total number of arrivals on a particular day of the week for all weeks for which sample data is collected. In case of this study sample data was collected for only one week.

eg. For a 3 week sample data, there will be 3 Mondays, Tuesdays, etc. Column 1 represents the total of the 3 Mondays.

Column 2 is available in three types of tables: Arrival Gap, Service Time and Counter Number. In case of Arrival Gap Tables this column contains arrival gap in minutes. In Service time Tables this column holds service time in minutes. In Counter Number Tables this column holds counter number.

Column 3 of these limit tables has average number of arrivals per day, i.e. total number of arrivals in Column 1 divided by the number of weeks for which data is collected.

Column 4 consists of information on cumulative of average of number of arrivals per day i.e. cumulative of Column 3.

Column 5 represents the probability of arrival.

Column 6 contains class intervals with respect to the probabilities shown in Column 5.

QUEUING SYSTEM ANALYSIS REPORT FOR SIMULATED DATA

FOR COUNT NO: 1

FOR 6 WEEKS OF SIMULATED DATA
TOTAL NO OF ARRIVAL OF CUST. : 5672
AVERAGE NO OF ARRIVAL / DAY : 135
AVERAGE WATING TIME/CUSTOMER : 1 Hours 9 Minutes 15 Seconds
AVERAGE SERVICE TIME/CUSTOMER: 3 Minutes 24 Seconds
AVERAGE ARRIVAL GAP: 2 Minutes 56 Seconds
AVERAGE COUNT.IDLE TIME/DAY..: 22 Minutes 46 Seconds
TRAFFIC INTENSITY:1.16
SERVER UTILISATION: 76.37%

QUEUING SYSTEM ANALYSIS REPORT FOR SIMULATED DATA

FOR COUNT NO: 2

FOR 6 WEEKS OF SIMULATED DATA
TOTAL NO OF ARRIVAL OF CUST. : 1128
AVERAGE NO OF ARRIVAL / DAY : 27
AVERAGE WATING TIME/CUSTOMER : 6 Minutes 31 Seconds
AVERAGE SERVICE TIME/CUSTOMER: 4 Minutes 16 Seconds
AVERAGE ARRIVAL GAP: 17 Minutes 34 Seconds
AVERAGE COUNT.IDLE TIME/DAY..: 6 Hours 17 Minutes 20 Seconds
TRAFFIC INTENSITY:0.24
SERVER UTILISATION: 19.08%

QUEUING SYSTEM ANALYSIS REPORT FOR SIMULATED DATA

FOR COUNT NO: 3

FOR 6 WEEKS OF SIMULATED DATA
TOTAL NO OF ARRIVAL OF CUST. : 3188
AVERAGE NO OF ARRIVAL / DAY : 76
AVERAGE WATING TIME/CUSTOMER : 52 Minutes 48 Seconds
AVERAGE SERVICE TIME/CUSTOMER: 5 Minutes 32 Seconds
AVERAGE ARRIVAL GAP: 5 Minutes 40 Seconds
AVERAGE COUNT.IDLE TIME/DAY..: 1 Hours 5 Minutes 39 Seconds
TRAFFIC INTENSITY:0.98
SERVER UTILISATION: 70.00%

QUEUE LENGHT'S REPORT FOR SIMULATED DATA

FOR 6 WEEKS OF SIMULATED DATA

LONGEST QUEUE LENGHT FOR COUNTER NO .1	=	65
AVERAGE QUEUE LENGHT/DAY FOR COUNTER NO .1	=	16
LONGEST QUEUE LENGHT FOR COUNTER NO .2	=	5
AVERAGE QUEUE LENGHT/DAY FOR COUNTER NO .2	=	0
LONGEST QUEUE LENGHT FOR COUNTER NO .1	=	36
AVERAGE QUEUE LENGHT/DAY FOR COUNTER NO .1	=	7

Simulated data analysis report indicated that average number of arrivals per day was 135 for Counter Number 1. Average waiting time at this counter is 1 hour 9 minutes and 15 seconds. Average service time was 3 minutes 24 seconds. The time gap between arrivals was 2 minutes 56 seconds. Average counter idle time was 22 minutes 46 seconds. Traffic intensity at this counter was as high as 1.16. Server utilization was 76.37%. This counter issues tickets for the Sayadri train, II Class Reservation.

The average number of arrivals for Counter Number 2 has been 27 customers per day. Average waiting time was 6 minutes 31 seconds while average service time was 4 minutes 16 seconds. Average arrival gap recorded was 17 minutes 34 seconds. Average counter idle times were 6 hours 17 minutes 20 seconds per day. Traffic intensity was as low as 0.24. Server utilization was 19.08%. This counter issues tickets for both Mahalakshmi & Sayadri 1st Class and A/C reservations.

Counter Number 3 had an average arrival of 76 customers per day. Average waiting time per customer was 52 minutes 48 seconds. Average service time at this counter was 5 minutes 32 seconds. Average idle time per day was 1 hour 5 minutes 38 seconds. Traffic intensity was 0.98 and server utilization was 70% at this counter. This counter issues tickets for the Mahalakshmi train II Class Reservation.

Simulated data Graphs:

These graphs are generated by the computer to provide a pictorial representation of the simulated data. Graphs are drawn for the entire system as well as for individual counters. These graphs appear in subsequent pages of this section.

The purpose of these graphs is to highlight arrival patterns for individual counters and the whole system, and during various hours of the day to enable the researcher to draw conclusions with the help of these graphs. There are 8 different graphs in all, drawn with help of the computer, for simulated data.

Graph Number 1: Relationship between number of arrivals and the days of the week, for the entire system.

Graph Number 2: Average number of arrivals v/s hours of the day, for the entire system.

Graph Number 3,4,5: These graphs show average number of arrivals v/s days of the week, for individual counters.

Graph Number 6,7,8: These graphs represent the relationship between various hours of the day and average number of arrivals, at individual counters.

It is observed from the graphical analysis that maximum number of arrivals were on Mondays and Saturdays for the entire system as well as individual counters and the busiest hours of the day were the periods 8-11 am and 2-3 pm for the entire system as well as individual counters.
