

## **CHAPTER VII- CONCLUSION.**

During the past two decades, it has become popular to be “Green” hoping to take advantage of this wave of popularity, some individuals and organizations have begun to advertise their product and service as environmentally friendly.

In the case of ecotourism in and around Kolhapur, the immediate origin should be the word “ecology” because Kolhapur district / selected area is very rich in biodiversity and has prosperous life. the significance of ecotourism through light upon its unique characteristics and attractiveness. If an eco-friendly action plan is implemented on a selected area for the development of ecotourism then it can satisfy issues like conservation of biological diversity, cultural diversity, and provides job to local population. It will also shares socio economic benefit with local communities by having their consent and participation in the management of ecotourism enterprise. Ecotourism helps in growth of environmental and cultural knowledge of the selected area. Above all, it will sensitize people about the beauty and fragility

of nature. Therefore, people must be prevented from behaving in irresponsible ways towards environment.

Development of ecotourism in in and around Kolhapur is the turning point of environment and economic development of the selected area. It is a new horizon and excellent opportunity for a new generation of Kolhapur. If the new generation contributes for the preservation of eco-aspects rather than destroying it, can lead to change the face of Kolhapur as a-eco-spot / ecotourism spot/ /environment friendly spot.

Natural resource management is an important issue that affects all. Everyone's well being indeed livelihood depends directly and indirectly on natural resources. A major assumption underlying the ecotourism is that cooperation between the industry's, government, NGO's and local communities will translate into successful planning and implementation of ecotourism. It must include an object to support and promote research development and innovation in environment information technology.

With the reference to our economy and development, none of the environmental problem can be solved in isolation or

development is possible without economic consideration. We cannot separate the economy and environment. Both the things are the part of a completely human existence in the society. By considering this point environment must be maintained while developing ecotourism in and around the selected area. Ecotourism is the tourism to the house or home. The ecotourists must care for the place visited as much as she or he cares for and appreciates home. The project is an effort and endeavor to change the face and hence the future of Kolhapur by developing ecotourism. An implementation of the concept of ecotourism can change the ecological image of Kolhapur in India and also the world.
