

OBSERVATIONS

BARR. BAVASAHEB KHAPDEKAR LIBRARY
SHIVAJI UNIVERSITY, KOLHAPUR.

Observations

The inoculated soil samples from different localities showed growth of cyanobacteria after 15 - 20 days. Initially the growth was bit slower but after 25 - 30 days the cultures showed rapid growth. Some forms especially those belonging to order Nostocales appeared at beginning while the Oscillatoriales, Stigonematales and Chroococcales showed slower growth and appeared at later phase of the culture. After three to four months most of the organisms had appeared in culutre and it was possible to observe them for the identification with the help of standard literature. The cultures were maintained for about 1 year to monitor the growth of slow growing forms. As the forms were appearing in the cultures they were identified up to species level studying their morphology as well as cultural characters.

Before inoculation the pH and EC of all soil samples collected from various localities was observed using Systronic digital pH and conductivity bridge. The results are shown in Table No. 1.

Table No. : 1 pH and EC of soil samples collected from study area

Sr. No.	Locality	pH	EC $\mu\text{Moh cms}^{-1}$
1	Bamnoli	7.5	53.53
2	Yewateshwar	7.3	83.75
3	Kas	7.2	25.55
4	Petri	7.1	24.81
5	Ambeghar	7.5	20.90
6	Shirsinge	7.5	42.42
7	Falani	7.2	50.08
8	Pateghar	7.1	23.25
9	Thoseghar	7.3	42.08
10	Parali	7.2	33.05

Locality wise enumeration of organisms during the observations has been given below.

Table No. : 2 Locality wise list of cyanobacterial species encountered in soil samples

Sr. No.	Locality	Name of the organism
1.	Bamnoli	Order Chroococcales Family: Chroococcaceae <i>Microcystis aeruginosa</i> Kutz <i>Chroococcus minutus</i> (Kutz.) Nag. <i>Gloeocapsa rupestris</i> Kutz. <i>Gloeocapsa atrata</i> (Turp.) Purification-

The cultures required frequent transfers in order to maintain them for longer period. All the soil samples showed some common forms (see Table No. 6) while some cyanobacterial forms were very specific to certain soils only. In order to study the biochemical characters the pure cultures of some of the forms were raised. Initially the correct identification was done based on morphological and cultural characteristics. Then the selected species were given frequent transfers in order to isolate them. Once these forms occurred growing in isolation they were raised in pure forms, to capture them in their log phase for their biochemical analysis. Plate Nos. II, III and IV show the culture vessels for individual pure culture. The photomicrographs on Plates V reveal the characteristic features of some individual isolates in pure culture.

Following strains of cyanobacteria were raised in pure cultures.

List of forms grown in pure cultures is as follows:

Chlorogloea fritschii Mitra.

Oscillatoria obscura Bruhl et Biswas

Oscillatoria curviceps Ag.ex. Gomont

Oscillatoria princeps Vaucher ex Gomont

Spirulina subsalsa Oerst. ex Gomont

Nostoc muscorum Ag. ex Born. et Flah.

Nostoc commune Vaucher ex Born. et Flah.

Nostoc microscopicum Carm. ex Born. et Flah

Anabaena spiroides Klebahn

Anabaena fertilissima Rao, C. B.

Anabaena doliolum Bharadwaja

Anabaena torulosa (Carm.) Lagerh. Ex Born. et Flah.

Oscillatoria minima

Biochemical characterization:

Algal cultures growing in pure forms were used for their biochemical characterization. Initially the cultures were captured in their log phase to obtain maximum cell count and then subjected to their chemical analysis. Three biochemical characters viz., chlorophyll a, carotenoid and carbohydrates in the form of glucose were estimated for each of the isolate. Table No. 3 shows the results for individual isolates for the three parameters.

Table No. : 3 Estimation of chl a, carotenoids and carbohydrates

Sr. No.	Name of isolate	Chlorophyll a µg ml ⁻¹	Carotenoids µg ml ⁻¹	Carbohydrates µg ml ⁻¹
1	<i>Chlorogloea fritschii</i>	92.6	2.728	18
2	<i>Oscillatoria obscura</i>	550.9	1.448	10.5
3	<i>Oscillatoria curviceps</i>	2123.6	2.008	11
4	<i>Oscillatoria princeps</i>	200.8	1.008	10.7
5	<i>Spirulina subsalsa</i>	160.3	1.64	78
6	<i>Nostoc muscorum</i>	101.4	1.68	52
7	<i>Nostoc commune</i>	72.0	1.04	89
8	<i>Nostoc microscopicum</i>	50.8	2.2	79
9	<i>Anabaena spiroides</i>	36.4	53.4	46
10	<i>Anabaena fertilissima</i>	50.5	2.616	22
11	<i>Anabaena doliolum</i>	102.9	72.8	26
12	<i>Anabaena torulosa</i>	48.8	84.0	48
13	<i>Tolypothrix fragilis</i>	438.6	3.896	80

The extracts prepared for chlorophyll and carotenoid estimation were scanned for total wavelengths ranging between 350 nm to 700 nm. (See the scan graphs for individual isolate). All the isolates showed distinct absorption maxima in both blue and red range. The extract for chlorophyll estimation showed the first peak at the range between 414 nm to 433 nm except *Nostoc commune* which showed the absorption maxima at 383nm, similarly the extract prepared for carotenoid also showed surprisingly absorption maxima at 382 nm. In the red region for the both the extracts absorption maxima were observe around 662 nm to 664 nm.
